

Output from Disassembler

```
28: mov  (%esp),%esi
2b: xor  %eax,%eax
2d: xor  %ecx,%ecx
2f: mov  0x20(%esp),%edi
33: mov  0x1c(%esp),%edx
37: lea  (%edi,%esi,1),%ebp
3a: mov  0x18(%esp),%edi
3e: add  %esi,%edi
40: add  %edx,%esi
42: lea  0x0(%esi),%esi
48: mov  (%edi,%eax,1),%edx
4b: add  $0x1,%ecx
4e: add  (%esi,%eax,1),%edx
51: mov  %edx,0x0(%ebp,%eax,1)
55: add  %ebx,%eax
57: cmp  0x24(%esp),%ecx
5b: jne  48
5d: addl $0x4,(%esp)
61: cmp  %ebx,(%esp)
64: jne  28
```

C generated from preprocessing step

```
bb28:
    eax = 0;
    ecx = 0;
    ebp = stk_esp_x20 + stk_esp;
    edi = stk_esp_x18 + stk_esp;
    esi = stk_esp_x1c + stk_esp;
bb48:
    edx = *(mem+[(edi+eax)/sizeof(int)]);
    ecx = ecx + 1;
    edx += *(mem+[(esi+eax)/sizeof(int)]);
    *(mem+(ebp+eax)/sizeof(int)) = edx;
    eax += ebx;
    if(stk_esp_x24 != ecx)
        goto bb48;
    stk_esp+=4;
    if(stk_esp!=ebx)
        goto bb28;
```

Conversion of
stack variables

$$\boxed{\text{red}} (\text{stk_esp}_{\text{initial}} + \text{stk_esp_x18}_{\text{initial}}) + \text{ebx} * i + 4 * j$$
$$\boxed{\text{green}} (\text{stk_esp}_{\text{initial}} + \text{stk_esp_x1c}_{\text{initial}}) + \text{ebx} * i + 4 * j$$

From profile: $\text{ebx} \gg 4$

→ loop interchange (between i loop and j loop) helps locality
